Product Manager task

Before the interview

1. Complete the task below. It should take you 30 minutes at most.
2. Use whatever tools you would use in the job, AI included. We expect you to. We are interested in how you work with it: what you ask, what you keep, what you change and why.
3. Bring your tickets in the format you would hand to an engineer, and have your AI chats or prompts handy. We will ask about them.

On the day (about 60 minutes, online)

15 minutes	Share your screen and walk us through your tickets.
15 minutes	We ask about your thinking and the choices you made.
20 minutes	We give you a problem from Zeller's world to talk through with us. Share a blank doc or slide to sketch your thinking as you go. There is nothing to prepare. We want to hear how you think, so this part is without AI.
10 minutes	Your questions for us.

Context

Zeller's goal is to have merchants ready to take payments within 2 minutes of signing up.

To help, onboarding looks up the merchant's business from their ABN or ACN using a third-party API, so they don't have to type in their details. The screens on the next page show the happy path of the "Your business information" step.

💡 Each lookup costs us $0.60.

Task

- Write the frontend Jira tickets for this happy path, ready to hand to an engineer. Make your assumptions clear.
  - Ignore the "I don't have an ABN" option.
- List the unhappy paths you would cater for if you were building this part of the product.

Guidance

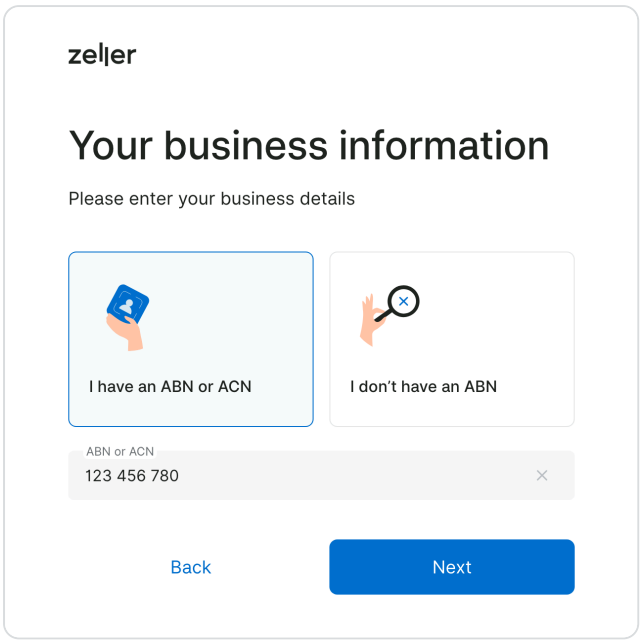

Spend no more than 30 minutes on this task.

- Approach it as if engineers will start building from your tickets tomorrow.
- Make clear any assumptions you made.

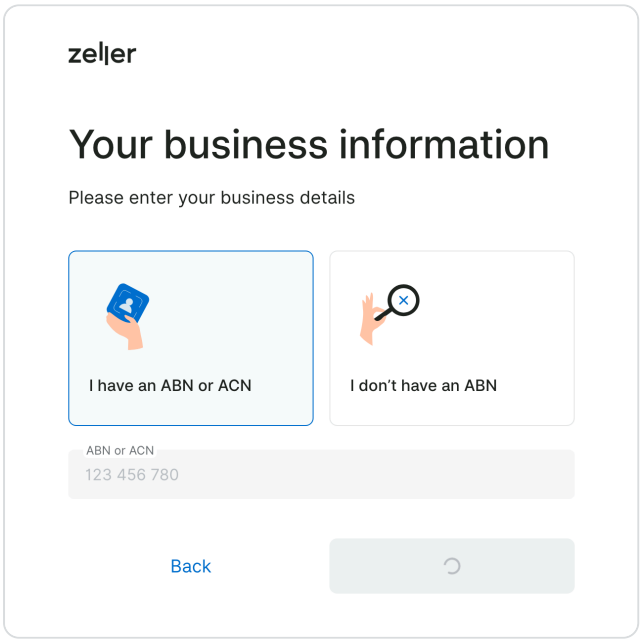

Your business information: happy path

The step as it works today when a merchant signs up to Zeller.

1. Enter ABN or ACN and tap Next

2. Looking up the business

3. Business details returned
